

## Project Description

I have created a web application on Phone book Web Page using PHP and Mysql. I have done on the basis of description provided by Placement Cell. I try my best to complete my assignment. Due to shortage of time I am unable to add some functionality .

So first I created a home page according to the description

Here user can Add new Contact and it will store in the database

Now user can add new contact by clicking on the button. Then user can add detail and save in database. Here user can get two options either SAVE or Reset.

User can get detail on clicking on show detail button. Here user can UPDATE, DELETE, RESET. Here user can fetch Database Value along with image.

User can easily update their contact here. User can easily delete their detail.
